1. The Research Institute of Metallurgy (Instytut Metalurgji) was located in the center of Gliwice N 50-17, E 18-40 and occupied a large modern three-story brick building. Offices and laboratories were in the front part of the building; in the rear there was a large workshop well equipped with different, new machine tools (lathes, milling machines, drilling machines, and presses).
2. The Institute was subordinate to the Ministry of Foundries (Ministerstwo Hutnictwa). I have no detailed information on its activities. I was there only once in the spring of 1952 and then in only one laboratory of the Institute. This laboratory conducted research on permanent magnets and magnetic alloys. Professor SMOLINSKI from the Warsaw Polytechnic Institute cooperated with the Institute of Metallurgy in this field. I heard that the Institute produced, up to June 1953, small series of cores not exceeding a few hundred kilograms.
